RELEASE READINESS · GO / NO-GO DECISION

PawHome: release readiness report for the second user validation round

A one-page decision for the team: is the prototype ready to put in front of users again? The answer, the evidence and what it takes to get to go.

Carla Achury · QA Analyst & Requirements Review · ISTQB CTFL

Portfolio sample · November 2026

> Case built on **PawHome**, a pet-care marketplace prototype created by a university team (Master in IT & Management, PUC Chile, 2025). The requirements review, test design, test execution and reports in this document are my own work. Screenshots come from the prototype; no real users or payments were involved.

NO-GO

Do not run the next validation round with prototype v1. The trust journey breaks in three places that users would notice immediately: the caregiver changes along the flow, the visit date is chosen by the system, and a guest can see another user's data. Feedback collected now would measure these bugs, not the product idea, as access problems already did in round one.

12	8	8	3
test cases executed	failed	bugs found	blocking (critical + high)

Blocking issues

Bug	Issue	Severity	Why it blocks
PAW-18	Guest mode shows another user's profile and personal data	Critical	Privacy breach; the sign-up flow cannot be tested.
PAW-19	Caregiver name and home change across the flow	High	Contradicts the core promise of verified, consistent caregivers.
PAW-20	Visit booked without choosing date or modality; date in the past	High	Users pay for a visit they did not schedule.

What it takes to reach GO

1. Fix PAW-18, PAW-19 and PAW-20, then retest the full journey from listing to Mis Reservas.
2. Fix PAW-21 so participants can find the visit they booked.
3. Replace sample data (2024 bookings, placeholder address) with realistic test data for the session.
4. Low-severity copy issues (PAW-24, PAW-25) can go with the next iteration.

What is working

- Guests can explore caregivers without creating an account.
- Trust badges and the caregiver's introduction are visible on the detail page.
- The CLP 2,000 Trust Visit fee is clear before payment, as validated with users.

Residual risks after the fixes

- Requirement gaps PAW-13 to PAW-17 (refunds, incidents, data privacy, response times) are still open and will come up in user interviews; the team should prepare answers.
- The filter results could not be verified with a single sample caregiver; add more sample data before the session.
